SEO + GEO Audit: teslatintla.com

Audit date: 2026-10-04 (UTC). Read-only. Nothing was modified, committed or deployed. Business: Audio MotorSports (Tesla window-tint site), 22025 S Avalon Blvd Ste A, Carson CA 90745. Companion files: SCHEMA_REPORT.md, AI_SEARCH_REPORT.md, pages.csv (143 sitemap URLs).

0. Method and evidence limits

Fetched with curl and python requests through the egress proxy: homepage, robots.txt, sitemap.xml, llms.txt, and **all 143 sitemap URLs** (all HTTP 200, parsed for title/H1/meta/ canonical/JSON-LD/images/links), plus /es/, /es/gallery/, a 404 URL, asset headers, and the home pages of shop.audiomotorsports.com and lacarstereo.com.

Not verifiable (blocked by proxy, not bypassed): - www.teslatintla.com (403 at proxy): **whether www redirects to apex is UNVERIFIED**. - http://teslatintla.com (proxy "host_not_allowed"): **http to https redirect UNVERIFIED** (HSTS header is present on https). - shop.teslatintla.com (403 at proxy): linked from every page; status UNVERIFIED. - www.lacartint.com, www.audiomotorsports.com, www.lacarbeats.com, www.lacaralarm.com, www.amspods.com: denied. Their apex domains answer 308 to www. Sister-site comparison is therefore based on what teslatintla.com says about them plus the two sister homepages that did load. - PageSpeed Insights returned 429 (shared quota) twice. **Core Web Vitals field/lab numbers are UNVERIFIED**; only static signals below. - Google Search Console, GBP, backlinks, rankings: no access. Anything about them is UNVERIFIED. - One note on data hygiene: an early homepage fetch landed in a shared /tmp folder and was overwritten with another site's HTML by a parallel process. I discarded it and re-fetched into a private folder; every number here comes from the clean re-fetch (homepage etag 21c63a7a..., 47,239 bytes).

1. Summary (heuristic scoring, not a Google metric)

Area	Score / 10	One-line
Crawlability / indexability	8	Clean robots, sitemap, canonicals, no noindex, all 143 URLs 200
On-page	6	Unique titles/H1/meta everywhere, but city titles are bare and the Carson page is titled "Avalon"
Content / E-E-A-T	6	Real prices, real hours, honest copy; 124 templated city pages, thin personal authorship
Schema	6	Valid JSON-LD everywhere; self-serving review/rating markup and entity duplication (see SCHEMA_REPORT)
Local SEO	6	NAP perfectly consistent; but the shop's own city (Carson) is mis-named and orphaned
Technical / perf signals	7	HTTP/2, brotli, immutable asset caching; 10 render-blocking CSS, 500 KB hero, no CSP
GEO / AI readiness	7	All AI crawlers allowed, llms.txt exists, FAQ-rich; llms.txt leaks internal notes
Sister-domain overlap	6	Deliberate Tesla-only vs lacartint split, but 124 doorway-style pages and a shared GBP/entity

2. Crawl and indexability (evidence)

- robots.txt (379 bytes): `User-agent: * Allow: /`, Sitemap line points to https://teslatintla.com/sitemap.xml, explicit Allow for GPTBot, OAI-SearchBot, ChatGPT-User, ClaudeBot, Claude-User, PerplexityBot, Google-Extended, Applebot-Extended, Bingbot. No Disallow anywhere. (Good. Nothing blocks assets, so rendering is safe.)
- sitemap.xml: 143 URLs, all returned 200 on fetch. No stale or redirecting entries. Composition: 124 city pages (`/tesla-tint-{slug}/`), 8 blog posts, blog index, gallery, locations, about, contact, book, payment-plan, privacy, terms, all-services, home.
- Weakness: every `lastmod` is 2026-09-19 or 2026-09-24 although the homepage Last-Modified header is 2026-10-02. Uniform dates look auto-stamped; Google tends to ignore them. `changefreq`/`priority` are ignored by Google.
- **Spanish pages are not in the sitemap.** Homepage declares hreflang en/es/x-default (reciprocal, correct) and /es/ plus 8 more /es/* URLs return 200 with `lang="es"` and self-canonicals, but none are in sitemap.xml. Evidence: homepage `<link rel=alternate hreflang=es href=/es/>`, sitemap contains zero /es/ URLs.
- Canonicals: all 143 pages have exactly one self-referencing canonical on the apex, trailing-slash form. No robots meta noindex on any page. No X-Robots-Tag on any page.
- Trailing slash: `/locations` and `/all-services` return 308 to the slash version (fine, permanent).
- Soft 404: an unknown URL returns a real 404 with `noindex, follow` and a branded page.
- Internal links: 1 orphan. `/tesla-tint-carson/` has zero inbound internal links from any of the 143 pages (including /locations/, which links to 121 city pages). The 123 other city pages have only 1 inbound link each (the /locations/ grid), i.e. three clicks deep with no cross-linking.
- Footer/header links to sister sites are site-wide: lacarbeats.com ~1,004 link occurrences (summed across all 143 pages), lacaralarm.com ~861, lacartint.com 293, audiomotorsports.com 289, amspods.com 288, shop.teslatintla.com 286 (UNVERIFIED target). These are normal "network chrome" links but they dominate the outbound profile.

3. On-page (all 143 pages parsed)

- Titles: 0 duplicates, 0 over 60 characters, 2 under 30 (privacy: 30/terms: 32 are fine; about = 21 chars is thin). Meta descriptions: all present, none duplicated, none over 160.
- H1: exactly one per page, no duplicates.
- Homepage title "Tesla Window Tint LA | Model 3, Y, S, X" (39 chars) is decent but has no "Carson", "ceramic", or price hook.
- City pages: `Tesla Window Tint {City} | Tesla Tint LA`, H1 `Tesla Window Tint for {City}`, meta `Tesla window tint for {City} — Solar Ceramic and 3M IR Ceramic on Avalon. Ask for Nick. (310) 513-8800.` One template, 124 times.
- **The shop's own page is mis-named.** `/tesla-tint-carson/` has title "Tesla Window Tint Avalon", H1 "Tesla Window Tint for Avalon", and breadcrumb "Tesla Window Tint for Avalon". The word "Carson" only appears in the address. This is the single page that should be the strongest local landing page for "tesla tint carson", and it neither says Carson in the title nor receives internal links.
- Utility pages have weak titles: /book/ "Book a Slot", /about/ "About", /privacy/, /terms/ (cosmetic, quick).
- Images: 0 missing alt on all pages except /locations/, where 121 of 123 city tile images have `alt=""`. They sit in a link grid; whether the adjacent link text carries the name was not verified, so treat as minor. Hero image has descriptive alt with address. Homepage `width/height` set on images; city tiles are lazy-loaded (122 of 123).
- Open Graph and Twitter tags present on all 143 pages.

4. Content and E-E-A-T

Positives (evidence on homepage, /about/, blog): - Published installed prices, hours, appointment slots, named person (Nick), real-sounding process detail (hand-cut on a glass board, 70% VLT legal fronts, overnight drop-off policy). - /about/ claims 20+ years, Google 4.8 from 654 reviews, Yelp 4.7 from 777 reviews, eight verbatim Yelp quotes (some dated 2019). - 8 blog posts at 1,177 to 1,782 words, each with BlogPosting schema; model pages also have FAQPage.

Gaps: - Authorship is a first name only ("Nick", "Zack runs the floor"). No surname, role, bio page, certifications (e.g., 3M/Llumar dealer status) are shown in the fetched text. Any such claims would need to come from the business; none were verified. - The review quotes are 2019-era in the sample read. Fresh reviews/dates would help trust. - Blog posts carry template-style repetition across models (same structure and numbers by design). Fine for users, light on unique insight (no photos of the actual car, no install timelines per VIN year). - City pages (see 6) are 1,762 to 2,443 words but mostly templated: sampled 8-word-shingle Jaccard between random city pairs averaged 0.32 (range 0.15 to 0.58). Long Beach vs Torrance 0.43; Brea vs Irvine 0.45. Local colour (streets, drive time, "mall asphalt heat") is unique per page, but the skeleton is shared.

5. Technical and performance signals

Headers (homepage, HTTPS): - Present: `strict-transport-security: max-age=31536000` (no includeSubDomains/preload), `x-content-type-options: nosniff`, `x-frame-options: SAMEORIGIN`, `referrer-policy: strict-origin-when-cross-origin`, `permissions-policy: geolocation=(), microphone=(), camera=()`. - **Missing: Content-Security-Policy** (0 matches). Also `access-control-allow-origin: *` on HTML (harmless for a public site but unnecessary). - HTTP/2, brotli (`content-encoding: br` confirmed), Vercel edge cache HIT. HTML `cache-control: public, max-age=0, must-revalidate`; assets `max-age=31536000, immutable` (good). - Mobile: `<meta name=viewport content="width=device-width, initial-scale=1">` on all pages. Responsive hero uses separate mobile/desktop preload. Real mobile rendering was not run; **mobile usability = UNVERIFIED beyond viewport tag**.

Core Web Vitals signals (static only, PSI blocked, so UNVERIFIED as measured values): - Homepage loads **10 stylesheets** in `<head>` (fonts, style, homepage-hero, offer-cards, ams-chat, sim, shop-white-banners, network-chrome, ams-plugin-tesla, paylater-note), all render-blocking. 5 scripts, all at the end of body (4 with defer). - LCP candidate: hero JPG `tesla-hero-desktop.jpg` is 500,992 bytes (declared 2560x1440), preloaded with fetchpriority=high. Mobile hero 249,244 bytes. Reasonable to compress further (WebP/AVIF). - Logo `ams-coin-gold.png` is 115,490 bytes at its 256w full size; the `<img>` has a 144w srcset variant and sizes=72px, so browsers should pick the small file (minor, only the fallback is large). - GTM (GTM-5G9HJLQ) in head on every page; a chat widget (`ams-chat.js`) loads site-wide. Both add main-thread work (INP risk, UNVERIFIED). - Largest HTML: /all-services/ at 96,868 bytes; average 30,951 bytes. Fine.

URL hygiene: lowercase, hyphenated, slash-terminated, flat structure (`/tesla-tint-{city}/`). Blog under `/blog/`. No parameters in internal links.

6. Local SEO

NAP (checked across all 143 pages): - Phone `(310) 513-8800` appears on 143/143 pages; address string `22025 S Avalon Blvd Ste A` on all pages with city "Carson" and ZIP 90745 in header/schema. The only other numbers are the SMS line (213) 429-1092 (3 pages, labelled "Text") and two form placeholders ("(310) 555-1234", "(310) 000-0000", harmless). - Hours Mon-Sat 9:30-18:00 are consistent in text and schema. Sunday closed. - Entity name is inconsistent by design: schema `name` = "Audio MotorSports" (home) vs "Tesla Tint LA" (city pages) vs "Audio MotorSports" in

parent. Needs one canonical name pattern matching the GBP. - Same GBP map link (ftid=0x80c33234c579b9bd:0xa886ff7f43445f0a) is in sameAs on teslatintla.com and the shop network; the Tesla site has no separate GBP evidence. **GBP category, reviews, photos, Tesla service attributes: UNVERIFIED (no access).**

Geo coverage: - Homepage schema areaServed lists 27 cities (Carson, Wilmington, Harbor City, Torrance, Gardena, Compton, Lomita, San Pedro, Long Beach, Signal Hill, Lakewood, Paramount, Lynwood, South Gate, Hawthorne, Lawndale, Redondo, Hermosa, Manhattan Beach, PV Estates, RPV, Rolling Hills Estates, Bellflower, Inglewood, Irvine, Anaheim, Santa Ana) plus a 16,093 m (10 mi) GeoCircle. That contradicts the 21.8-mile Brea drive and the 124 pages that cover Malibu, Rancho Cucamonga, Chino, Pomona, Pasadena, Santa Monica and others. A 10-mile radius with pages for 40-mile cities is internally inconsistent. - South Bay coverage is strong (Torrance, Redondo, Hermosa, Manhattan, Hawthorne, Lawndale, Lomita, San Pedro, PV, RH, RHE, El Segundo all have pages). Long Beach/Orange County: Long Beach, Lakewood, Signal Hill, Cerritos, Anaheim, Irvine, Santa Ana, Costa Mesa, Huntington Beach, Fullerton, Brea present. LA westside, SGV, IE also present. - City pages are explicit that "We are not in {City}", with drive time and route. Honest and good for users and for AI answers ("where is X"), but they are by definition location-landing pages for places without a presence, the pattern Google calls doorway-style when thin. They are long and have unique detail, so risk is moderate, not high. - `/contact/`, `/locations/` and the footer show the Carson address; embedding of a Google Map was not verified.

7. Sister-domain overlap and cannibalization

What was verified: - teslatintla.com says explicitly: this site is Tesla glass only, "Other vehicles go to LA Car Tint" (FAQ), and it links "Automotive Window Tint" to https://www.lacartint.com/ on every page (293 links). lacartint.com was not fetchable (www denied), so its titles/pages could not be compared directly. **Overlap with lacartint.com = UNVERIFIED on their side; the stated intent is a clean split (Tesla vs everything else).** Risk areas to check once reachable: lacartint pages for "Tesla window tint", "ceramic tint Carson", "Los Angeles window tint prices", and whether lacartint has city pages that mirror these 124. - shop.audiomotorsports.com (fetched): title "Car Window Tint & Car Audio in Carson | Audio MotorSports", canonical points to https://www.audiomotorsports.com/ (so it is a duplicate-host canonicalized to the main site, good). Its nav has "Window Tint / Tesla Tint / Automotive Window Tint / Tint Removal" and says "Tesla glass is Tesla Tint LA, same tint bay, specialty site." Overlap with teslatintla is low and defers to it. - lacarstereo.com (fetched): `<meta name="robots" content="noindex, nofollow">` on the homepage, og:url www.lacarstereo.com, JSON-LD listing teslatintla.com in sameAs. It is intentionally not indexable at the time of fetch (maybe pre-launch). No cannibalization possible while noindexed. Flag for the owner to confirm this is intended. - lacarbeats.com, lacaralarm.com, amspods.com: apex redirects to www (308); www denied. Overlap UNVERIFIED. They are stereo/alarm/Harley topics, so topical overlap with Tesla tint is low by design. - All of these sites share the same NAP, the same legal entity ("Audio MotorSports Inc" in the lacarstereo schema), the same phone, the same GBP link and cross-reference each other in `sameAs`. For Google Local that is one business, one listing; the Tesla site cannot earn its own local pack position separate from the main GBP. For organic it means all six domains compete for "Carson" brand-adjacent queries from one entity. - Within-site cannibalization: homepage, 124 city pages and 6 model blog posts all target "tesla window tint {place|model}". No keyword duplicates in titles, but the homepage vs `/tesla-tint-los-angeles/` and `/tesla-tint-carson/` are the likeliest to split "tesla tint Los Angeles/Carson" intent. Model Y L / Model Y blog posts vs the homepage simulator vs the city-page FAQs repeat the same price matrix in 100+ places, so no single page is the clearly canonical price source for search.

8. Prioritized findings

Critical 1. Carson page mis-named and orphaned (/tesla-tint-carson/). 2. Spanish pages (9 /es/ URLs) exist and are hreflang-linked but are missing from the sitemap.

High 3. 124 templated city pages for a one-bay shop: doorway risk and crawl-budget dilution; each has only one inbound link. 4. areaServed (10-mile GeoCircle) contradicts the 40+ mile city pages. 5. Self-serving AggregateRating/Review markup on 126 business nodes (no Google rich result, policy risk). See SCHEMA_REPORT.md. 6. llms.txt leaks internal instructions and contradicts site counts. See AI_SEARCH_REPORT.md.

Medium 7. 10 render-blocking CSS files plus 500 KB hero plus 115 KB logo on the homepage (CWV unverified). 8. No Content-Security-Policy header; HSTS lacks includeSubDomains/preload. 9. Homepage title has no Carson/ceramic/price qualifier; /book/, /about/ titles generic. 10. Uniform sitemap lastmod and unneeded changefreq/priority. 11. Entity name inconsistent (Audio MotorSports vs Tesla Tint LA) across schema nodes.

Low 12. 121 empty alts on /locations/ tiles. 13. Reviews quoted are old (2019 in sample). 14. Sister-site internal outlink volume (~2,700 sister-domain link occurrences across the 143 pages, about 19 per page).

9. Priority actions with next steps

See the findings list in the final message and each report for exact steps.

Schema Report: teslatintla.com

Date: 2026-10-04. Source: JSON-LD parsed from all 143 sitemap URLs (python json.loads). Rich Results Test / Schema validator not reachable, so "valid" below means well-formed JSON with sensible schema.org types, not Google eligibility confirmation (UNVERIFIED).

Inventory (node counts across 143 pages)

Type	Count	Notes
BreadcrumbList	141	All pages except homepage and /book/
FAQPage	132	Homepage, locations, 124 city pages, 6 model posts
AutoRepair	56 (+ nested)	City pages and /locations/ business node
LocalBusiness-family total	127 business nodes	Homepage uses AutomotiveBusiness, city pages AutoRepair
BlogPosting	8	Model posts + 2 comparison posts
ImageObject @graph	1	/gallery/ (9 images, thumbnails from i.ytimg.com)
WebSite, AboutPage, ContactPage, ItemList, Blog, WebPage	1-2 each	Utility pages
Product / Service / Offer / VideoObject	0	None present

Parse errors: 0. (One apparent error in my tool was the /gallery/ `@graph` wrapper, which is valid.)

What is good

- Homepage `AutomotiveBusiness` has `@id` https://teslatintla.com/#business, NAP matching the page, geo coordinates (33.8270587, -118.2641283), openingHoursSpecification Mon-Sat 09:30-18:00, 12 sameAs links (Instagram, YouTube, Facebook, TikTok, Yelp, Google Maps ftid, plus sister domains), logo, image, `parentOrganization` -> audiomotorsports.com/#business.
- Homepage FAQPage: 7 questions whose text matches the visible FAQ headings (Which Tesla models, GPS/phone signal, Model Y duration, windshields, payment plan, appointment, overnight drop-off).
- Breadcrumb names/URLs match visible breadcrumbs; canonical host consistent (apex).
- WebSite node present with publisher reference to the business @id.

Problems

1. **Self-serving review and rating markup (126 nodes carry aggregateRating, 55 carry Review arrays).** Homepage, /locations/ and city pages mark the business itself with `aggregateRating` 4.8 / 654 and individual Yelp reviews (e.g., "Rudy R.", 2023-06-09, publisher Yelp). Google does not show review stars for LocalBusiness/Organization markup written by the business about itself, and mixing Google's count (654) with Yelp-sourced review text under the same node invites a mismatch/spam-policy flag. Gain: none for Google; risk: low-moderate. AI engines read the text anyway, so keep the visible reviews, drop the structured Review/aggregateRating from city pages (and keep at most one rating statement on the homepage only if you can cite the source).

2. **City pages create a second, unlinked entity.** Each city page defines an `AutoRepair` with no `@id`, `name` "Tesla Tint LA", full Carson address and the same geo, while the Review's `itemReviewed` references `https://teslatintla.com/#business`. 124 pages therefore assert 124 anonymous copies of the shop plus a reference to the real one. Fix: use `"@id": "https://teslatintla.com/#business"` (same node) or reference it with `{"@id": ...}` instead of re-declaring it.
3. **areaServed contradicts content.** Homepage lists 27 cities plus a 10-mile GeoCircle (`geoRadius` 16093 m). Pages cover Brea (21.8 mi), Malibu, Pasadena, Rancho Cucamonga etc. City pages set `areaServed` to a single City each (e.g., Brea) while their body says "We are not in Brea". Pick one story: the shop is in Carson, serves customers within X miles. Remove the 10-mile circle or widen to match.
4. **Entity naming split.** Homepage `name` = "Audio MotorSports" (alternateName includes "Tesla Tint LA"); city pages `name` = "Tesla Tint LA"; parent also "Audio MotorSports" typed `AutoRepair`. Parent/child both typed AutoRepair/AutomotiveBusiness at the same address and phone. Use one @id per real entity, with the Tesla site as `brand`/department or `ServiceChannel`, matching the single Google Business Profile name.
5. **Employee node names an individual** ("Nick", jobTitle "Sales · Acoustic Audio") on all 127 business nodes: odd job title for a tint site, no surname, and `email` (audiomotorsports@gmail.com) is exposed in markup. Remove `employee` or give a proper `Person` with role "Tesla tint specialist" only if the business agrees to be named; consider dropping the gmail address from schema.
6. **No Service/Offer markup despite published prices.** The site publishes a full price matrix (e.g., Solar Ceramic Model Y doors+back $349, 3M IR $549, windshield $189/$299) but no `Service` + `Offer` (or `hasOfferCatalog`) nodes. Add one `Service` per film package with `offers` (price, priceCurrency USD, `areaServed`), on the homepage only, not 124 copies.
7. **BlogPosting is thin.** Fields present: headline, datePublished (e.g., 2026-08-27), description, author (Organization "Tesla Tint LA"), publisher (Organization, no logo), mainEntityOfPage. Missing: `dateModified`, `image`, publisher `logo`, a Person author. Add them (quick).
8. **FAQPage rich results.** Google restricts FAQ rich results to authoritative government/health sites since 2023, so the 132 FAQPage nodes will not produce SERP snippets (UNVERIFIED for this domain, but per Google's published policy). They still help AI parsers and are harmless; but identical price-heavy FAQ text repeated across 124 city pages offers no extra benefit.
9. **Homepage has no BreadcrumbList** (fine) and **/book/** only has the business node (no `ReservationAction`/`potentialAction`). Optional: add `potentialAction` with `ReserveAction` target /book/.
10. **hreflang/inLanguage:** Spanish pages /es/* exist; checking for `inLanguage` or translated schema was not done beyond /es/ canonical/hreflang tags (reciprocal and correct).
11. /gallery/ ImageObjects point to YouTube thumbnails (i.ytimg.com) while the page shows videos: `VideoObject` (name, thumbnailUrl, uploadDate, embedUrl) would be the correct type and is eligible for video results.

Recommended homepage JSON-LD shape (not published, example only)

One `@graph` with: `AutomotiveBusiness` (@id #business, name matching GBP, one address, geo, hours, sameAs, areaServed consistent with a stated radius), `WebSite`, `Service` x 3 (Solar Ceramic, 3M IR Ceramic, Windshield) each with `Offer`, `FAQPage`. City pages: `WebPage` + `BreadcrumbList` + `{"@id": "#business"}` reference only.

AI Search (GEO) Report: teslatintla.com

Date: 2026-10-04. Evidence from live fetches. No citation/mention testing was run in ChatGPT/Perplexity/Gemini (no access), so **actual AI visibility is UNVERIFIED**.

1. AI crawler access (robots.txt, fetched 200, 379 bytes)

Crawler	Rule	Result
GPTBot	Allow: /	Allowed
OAI-SearchBot	Allow: /	Allowed
ChatGPT-User	Allow: /	Allowed
ClaudeBot	Allow: /	Allowed
Claude-User	Allow: /	Allowed
PerplexityBot	Allow: /	Allowed
Google-Extended	Allow: /	Allowed
Applebot-Extended	Allow: /	Allowed
Bingbot	Allow: /	Allowed
CCBot, Bytespider, Meta-ExternalAgent, Amazonbot	not listed	Allowed by `User-agent: *`

No Disallow lines, no Cloudflare/WAF challenge observed (Vercel edge served all 143 pages to a generic UA). **UNVERIFIED:** whether Vercel firewall bot rules treat GPTBot differently from my UA; no way to test as those agents.

All content is server-rendered static HTML (47 KB homepage, text visible without JS), so non-JS AI fetchers see the full copy. The price simulator is JS-driven but the price matrix is also in text and in llms.txt.

2. llms.txt (https://teslatintla.com/llms.txt, 200, text/plain, 2,910 bytes)

Exists and is well-structured (shop facts, price matrix, blog, gallery, locations, "How to answer"). Problems: - **Leaks internal notes**: "Canonical matrix is teslatintla/assets/sim/prices.js", "owner-locked $599", "GET /api/blog reads teslatintla/data/blog.json. No write API.", "Do not invent other prices", "Never say financing, credit, finance, or 0%", "Do not mention warranty", "Do not offer DSP, wraps, or PPF". These read as internal agent instructions and expose repo paths. Remove paths and rewrite the compliance directives as neutral public statements (or drop them). - **Count inconsistencies**: llms.txt says "111 Tesla city pages"; sitemap has 124 `/tesla-tint-*/` URLs; /locations/ title says "121 drive-ins". Pick one number or remove it. - `/llms-full.txt` timed out on one request through the proxy and was not retried (UNVERIFIED whether it exists). llms.txt does not link to /about/, /contact/, /book/ or /payment-plan/. - No Spanish pointer even though /es/ exists. - The file claims "Prices verified September 2026"; good freshness signal, but no per-page dates on prices.

3. Passage citability (sampled homepage, model posts, city pages)

Strong: - Direct, quotable facts with numbers: "Model Y doors-and-back install is usually two to three hours", "Front side windows stay at 70% VLT under California law", "Solar Ceramic doors plus back glass is $349 installed", "Appointments are 10:00 AM or 12:00 PM only. Monday through

Saturday, 9:30 AM to 6:00 PM. Sunday closed." - Q/A structure: 132 pages have FAQ blocks with 4 to 11 answers; answers are self-contained (50 to 80 words, include the entity and the price). - Clear differentiators: "Tesla glass only", hand-cut on glass board, ceramic does not affect GPS/ phone signal (an answerable question).

Weak: - City pages repeat the same price matrix in a 100+ word FAQ answer that reads like a data dump; answer engines may choose any of 124 near-identical passages, none clearly authoritative. Make the homepage (or one /pricing/ page) the canonical source and link to it. - Opening passages are narrative ("We are not in Brea. ... Zack runs the floor.") rather than a 1 to 2 sentence definition AI can lift. - No comparison tables in HTML with `<table>` for price matrix (prices are in cards/JS), so tabular extraction is harder. Check: matrix present as text in FAQ only (verified); a real HTML table was not found on the homepage text. - Blog posts (1,177 to 1,782 words) lack author byline/person, update date in visible text (schema has datePublished only) and external citations (3M, Llumar, CARB/CVC 26708 for VLT). No outbound sources were present in the sampled posts.

4. Entity clarity and brand signals

- One entity expressed three ways: "Audio MotorSports", "Tesla Tint LA", "Tesla Tint Los Angeles". Public contact name "Nick" appears everywhere with no surname, so AI cannot disambiguate the person.
- Cross-site consistency is high (same NAP/phone/hours on 143 pages; sister sites reference teslatintla.com in sameAs), which helps knowledge-graph reconciliation. But the same GBP/ map link serves six domains.
- sameAs includes Yelp, Google Maps ftid, Instagram, YouTube, Facebook, TikTok. **Missing:** Wikipedia/Wikidata (unverified whether any exists), BBB, Tesla-owner forums/Reddit mentions, Apple Maps/Bing Places. Off-site mentions and review corpora (Reddit, Tesla Motors Club) drive a lot of AI citations; none checked (UNVERIFIED).
- Review data is self-hosted quotes (Yelp, up to 2019). AI engines weight third-party review platforms; ensure Yelp and Google profiles carry the same Tesla-specific language.

5. Agent readiness

- /llms.txt present; no /ai.txt (request timed out through the proxy, UNVERIFIED), no /.well-known/security.txt (404), no sitemap index (404, not required).
- A chat widget (`ams-chat.js`) loads site-wide; whether it exposes anything to agents was not tested.
- Sitemap has no /es/ URLs, so the Spanish content (an extra answer-engine audience) is not discoverable via sitemap.

6. Quick wins for AI citation

1. Clean llms.txt (remove internal paths/directives; fix counts; add About/Contact/Book/ Payment links).
2. Add a single "Tesla window tint prices (Oct 2026)" HTML table to the homepage or /pricing/, dated, and have city pages link to it instead of repeating the 100+ word matrix.
3. Add visible byline + "Updated {date}" on blog posts, with a Person author and sources (3M/ Llumar spec sheets, California Vehicle Code 26708).
4. Add Service/Offer schema (see SCHEMA_REPORT.md).
5. Put a 40 to 60 word definition ("Tesla Tint LA is the Tesla window-tint bay of Audio MotorSports in Carson, CA...") as the first paragraph of the homepage and /about/.
6. Add sitemap entries for /es/ pages.

7. Build off-site mentions: Reddit r/TeslaModelY, Tesla Motors Club, YouTube descriptions linking the homepage (YouTube gallery is already a strength: 9 jobs on the Audio MotorSports channel).
